MA137 – Calculus 1 with Life Science Applications Semilog and Double Log Plots (Section 1.4)

Department of Mathematics University of Kentucky

Logarithmic Scales

- When a physical quantity varies over a very large range, it is often convenient to take its logarithm in order to have a more manageable set of numbers.
- Quantities that are measured on logarithmic scales include
 - acidity of a solution (the **pH scale**),
 - earthquake intensity (Richter scale),
 - loudness of sounds (decibel scale),
 - light intensity,
 - information capacity,
 - radiation.
- In such cases, the equidistant marks on a logarithmic scale represent consecutive powers of 10.

The pH Scale

Chemists measured the acidity of a solution by giving its hydrogen ion concentration until Sorensen, in 1909, defined a more convenient measure:

$$\mathsf{p}\mathsf{H} = -\log[\mathit{H}^+]$$

where $[H^+]$ is the concentration of hydrogen ions measured in moles per liter (M).

Solutions are defined in terms of the pH as follows:

those with pH = 7 (or $[H^+] = 10^{-7}M$) are *neutral*,

those with pH < 7 (or $[H^+] > 10^{-7}$ M) are *acidic*,

those with pH > 7 (or $[H^+] < 10^{-7}$ M) are *basic*.

The hydrogen ion concentration of a sample of each substance is given. Calculate the pH of the substance.

(a) Lemon juice:
$$[H^+] = 5.0 \times 10^{-3} \text{M}$$

(b) Tomato juice:
$$[H^+] = 3.2 \times 10^{-4} \text{M}$$

(c) Seawater:
$$[H^+] = 5.0 \times 10^{-9} M$$

Example 2 (Ion Concentration):

Calculate the hydrogen ion concentration of each substance from its pH reading.

(a) Vinegar: pH = 3.0

(b) Milk: pH = 6.5

Semilog Plots

- In biology its common to use a semilog plot to see whether data points are appropriately modeled by an exponential function.
- This means that instead of plotting the points (x, y), we plot the points $(x, \log y)$.
- In other words, we use a logarithmic scale on the vertical axis.

Logarithmic Scales

Graphs for a Science article

How to Read a Semilog Plot

You need remember is that the log axis runs in exponential cycles. Each cycle runs linearly in 10's but the increase from one cycle to another is an increase by a factor of 10. So within a cycle you would have a series of: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 (this could also be 0.1-1, etc.). The next cycle begins with 10 and progresses as 20, 30, 40, 50, 60, 70, 80, 90, 100. The cycle after that would be 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000.

Below is a picture of semilog graph paper.

Example 3:

Suppose that x and y are related by the expression

 $y = 4 \cdot 10^{-x/2}$ [= 4 · (10^{-1/2})^x = 4 · (0.316)^x].

Use a logarithmic transformation to find a linear relationship between the given quantities and graph the resulting linear relationship in the semilog (or log-linear) plot.

Lines in Semilog Plots

• If we start with an **exponential function** of the form $y = a \cdot b^x$ and take logarithms of both sides, we get

$$\log y = \log(a \cdot b^{x}) = \log a + \log b^{x}$$

 $\log y = \log a + x \log b$

If we let $Y = \log y$, $M = \log b$, and $B = \log a$, then we obtain

Y = B + Mx,

i.e., the equation of a line with slope M and Y-intercept B.

• So if we obtain experimental data that we suspect might possibly be exponential, then we could graph a semilog scatter plot and see if it is approximately linear.

Example 4:

When $\log y$ is graphed as a function of x, a straight line results. Graph the straight line given by the following two points

$$(x_1, y_1) = (0, 40)$$
 $(x_2, y_2) = (2, 600)$

on a log-linear plot. Determine the functional relationship between x and y. (**Note:** The original x-y coordinates are given.)

Example 5:

When $\log y$ is graphed as a function of x, a straight line results. Graph the straight line given by the following two points

$$(x_1, y_1) = (1, 4)$$
 $(x_2, y_2) = (6, 1)$

on a log-linear plot. Determine the functional relationship between x and y. (**Note:** The original x-y coordinates are given.)

Example 6:

Consider the relationship $y = 6 \times 2^{-0.9x}$ between the quantities x and y. Use a logarithmic transformation to find a linear relationship of the form

$$Y = mx + b$$

between the given quantities.
